**Dual targeting of glioblastoma multiforme with a proteasome inhibitor (Velcade) and a phosphatidylinositol 3-kinase inhibitor (ZSTK474)**

LEHANG LIN, DARIA GAUT, KAISHUN HU, HAIYAN YAN, DONG YIN and H. PHILLIP KOEFFLER

Int J Oncol 44: 557-562, 2014; DOI: 10.3892/ijo.2013.2205

Following the publication of the above article, an interested reader drew to the attention of the Editorial Office that GAPDH bands featured for the U87 cell line (left-hand panels) in Fig. 5 on p. 561 were strikingly similar to the GAPDH bands for the U118 cell line (right-hand panels) shown in Fig. 1 on p. 559, even though the experiments shown in these figures were performed under different experimental conditions. Upon examining their data, the authors have realized that Fig. 5 was presented incorrectly; specifically, the cell lines ('U87' and 'U118') in Fig. 5 were mistakenly labeled in reverse, and the GAPDH bands from the right-hand panels of Fig. 1 were inadvertently re-used in the left-hand panels of Fig. 5.

The authors have now corrected the cell line labels and replaced the GAPDH bands in the left-hand panels of Fig. 5 with alternative data from a repeated experiment. The revised version of Fig. 5 is shown below. It is important to note that this error did not affect the overall conclusions reported in the study. The authors are grateful to the Editor of *International Journal of Oncology* for allowing them this opportunity to publish a Corrigendum, and all the authors agree with its publication. Furthermore, the authors deeply apologize to the readership for any inconvenience caused.

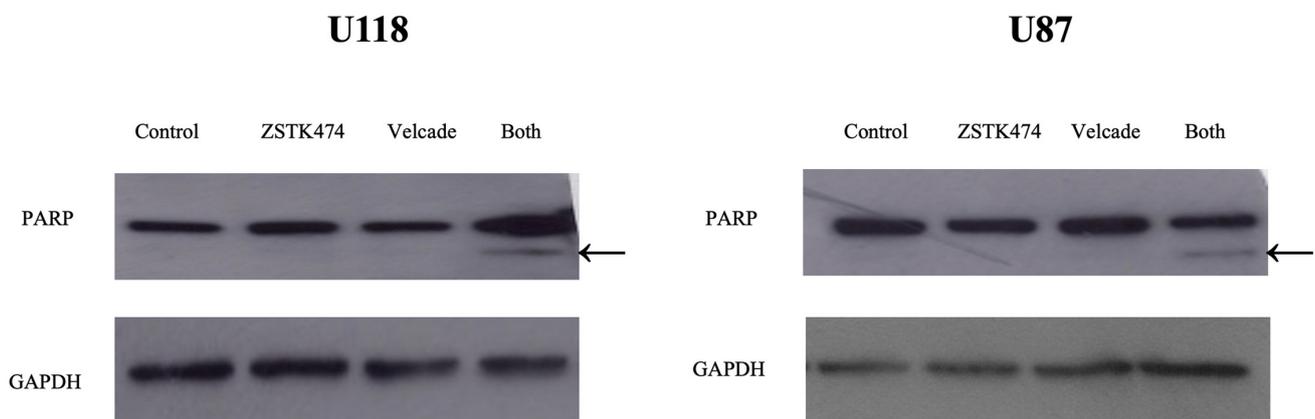

Figure 5. Effects of Velcade and ZSTK474 on the expression of apoptotic-related protein PARP in GBM cell lines. U118 and U87 cells were cultured for 24 h with Velcade (100 nM), ZSTK474 (2.5 μM), or both simultaneously. Lysates were made and subjected to western blot analysis for poly(ADP-ribose) polymerase (PARP), generating a C-terminal 85-kDa apoptotic fragment when cells were treated with both drugs (arrow).
