

Figure S1. Effects of OGT knockdown on EMT markers in MCF-7 cells transfected with siOGT or siScramble and cultured under monolayer, anoikis resistant and reseeding conditions. (A) Representative westernblots of E-cadherin, N-cadherin, β -catenin, and actin (as a protein loading control). Densitometry analysis of (B) E-cadherin, (C) N-cadherin and (D) β -catenin normalized by β -actin. Data are presented as the mean \pm standard deviation of three independent experiments.
