

Figure S1. Representative micrographs of IGF1 immunohistochemical staining in intestinal-gastric cancer. Paraffin sections from intestinal-subtype gastric tissues were incubated with polyclonal antibodies against IGF1. (A) Low to (B) moderate IGF1 staining in two gastric biopsies (TNM2a and TNM3b, respectively). Arbitrary values for *IGF1* expression were 70 and 507 vs. CT35, respectively. IGF1, insulin-like growth factor 1.

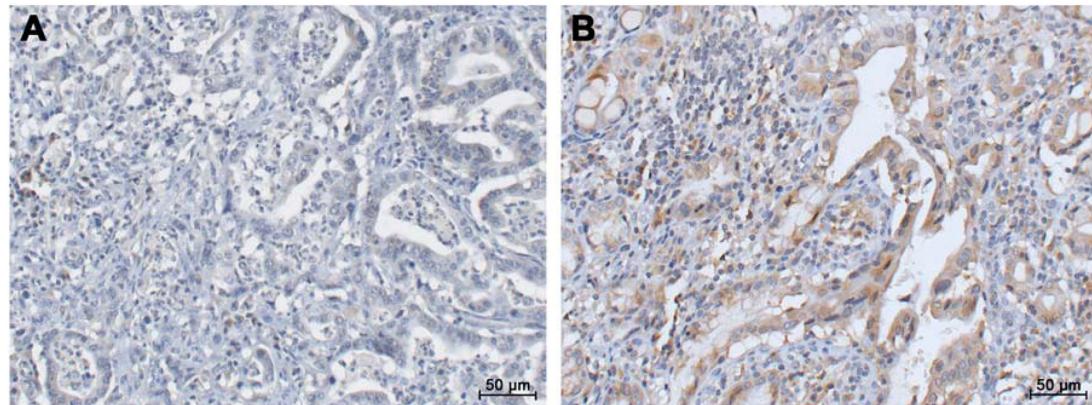

Table SI. Statistical analysis of mRNA expression of genes in intestinal-subtype gastric carcinoma relative to the non-tumoral tissues.

Genes	Normal gastric tissues (n=11)	Intestinal sub-type carcinoma (n=16)	P-value <sup>a</sup>	% underexpression relative to normal gastric tissues	% overexpression relative to normal gastric tissues
<b>Growth factors and receptors (n=10)</b>
