

Figure S1. Effect of SLRP downregulation on the expression of β -catenin at the protein level. HTB94 cells were transfected for 48 h with specific siRNAs against lumican, decorin and biglycan. A non-specific RNA sequence was used as control (siScr). (A) β -catenin protein levels in HTB94 cells were determined by western blot analysis. The position of the nearest respective protein marker band is depicted to the right. (B) β -catenin (100 kDa) protein bands were densitometrically analyzed and adjusted against actin (42 kDa). Representative plots are presented. Results represent the average of three separate experiments. Data are the means \pm SEM; NS, not significant.
