Figure S1. (A) Effects of positive control cisplatin on the viability of A2780 cells detected for 24 h. (B) Effects of aconitine on the viability of IOSE80 cells detected for 24 h. **P<0.01 vs. control group at 24 h.
Figure S2. Schematic diagram of the mechanisms of aconitine on A2780 cells via adjusting ERβ-mediated apoptosis, DNA damage and migration. ERβ, estrogen receptor β; VEGF, vascular endothelial growth factor A; HIF-α, hypoxia-inducible factor; PHD2, prolyl hydroxylase domain-containing protein 2; MMP, matrix metalloproteinase; ATM, ATM serine/threonine kinase; p-, phosphorylated; PARP, poly (ADP-ribose) polymerase.
