

Figure S1. Absorption assay of mice sera. Mice sera were pre-incubated with 500 μ M B19V-VP1u or truncated B19V-VP1u proteins for 1 h at 37°C before ELISA was performed. Data are shown as the mean \pm SD. Similar results were obtained in three-repeated experiments. *P<0.05. (n=4 for each group). B19V, B19 virus; VP1u, VP1-unique region; OD, optical density; comp, competitive ELISA (the absorption experiment was performed before ELISA).
