

Figure 2: IHC score of FXR in PD-L1 high responder and non-responder. The figure consists of two panels. The left panel shows two immunohistochemistry (IHC) images of tumor tissue. The first image is labeled "PD-L1^{high} responder" and shows brown staining (FXR) in the tumor cells. The second image is labeled "PD-L1^{high} non-responder" and shows blue staining (FXR) in the tumor cells. The right panel is a dot plot showing the IHC score of FXR for each group. The y-axis is labeled "IHC score of FXR" and ranges from 0 to 12. The x-axis has two categories: "PD-L1^{high} responder" and "PD-L1^{high} non-responder". The "PD-L1^{high} responder" group has 12 data points (red dots) with a mean score of approximately 4. The "PD-L1^{high} non-responder" group has 12 data points (blue dots) with a mean score of approximately 2. A horizontal line connects the two groups, with a p-value of 0.027 indicated above it.
