Figure S1. Kaplan-Meier curves for overall survival following surgery. A total of 70 patients were examined. Patients were divided into the high and low expression groups according to the median value of miR-4730 expression in the tumor tissue divided by that in non-tumorous liver tissue. Non-tumorous tissue was collected from peritumoral liver tissue of patients with liver cancer. There was no significant difference in prognosis between the two groups (P=0.786). T, tumor tissue; NT, non-tumor tissue.
Figure S2. Correlation between HMGA1 and miR-4730 expression in formalin-fixed paraffin-embedded non-tumorous liver samples ($P=0.646$ and $\rho=0.057$, determined using Spearman’s rank correlation coefficient). Patients without HMGA1 expression (n=3) were excluded. HMGA1, high mobility group A1.
