

Figure S1. Changes of the NLR value throughout chemotherapy treatment in unresectable GC patients. Fluctuations of pretreatment NLR values in each case were categorized into an (A) NLR-low group and an (B) NLR-high group by 1st-line pretreatment NLR value. Dotted lines denote the patients under treatment at the time of the analysis, and solid lines represent the patients who had no chemotherapy treatment. A red dot or solid line denotes patients with a worse NLR value (>3.0) during chemotherapy. A blue dot or solid line indicates patients with a lower NLR value (<3.0) throughout chemotherapy. A green dot or solid line denotes patients with a lower NLR value (<3.0) during chemotherapy at least once. A black dot or solid line indicates patients with high NLR values (>3.0) throughout chemotherapy.
