

Figure S1. In immunocytochemistry/immunofluorescence, triplicate x200 higher magnification views were randomly selected and the number of cells that formed lamellipodia was calculated as a percentage of the total number of cells. The data are presented as the mean \pm SEM. All experiments were performed in triplicate and repeated three times (one-way ANOVA with Bonferroni's multiple comparison test, two-tailed). * $P < 0.01$. SCU, scutellarin.
