

Figure S1. Immunohistochemical staining of the hyalinizing trabecular tumor. Positive expression of (A) thyroglobulin (magnification, x100; scale bar, 100 μm), (B) cytokeratin 19 and (C) thyroid transcription factor-1 within the tumor tissue (magnification, x20; scale bar, 500 μm). (D) Focal positive expression of galectin-3 within the tumor tissue (magnification, x100; scale bar, 100 μm). Negative expression of (E) calcitonin and (F) chromogranin A within the tumor tissue (magnification, x100; scale bar, 100 μm). (G and H) Vessel-like dilated spaces that were negative for CD34 and podoplanin (magnification, x40; scale bar, 200 μm).

Figure S2. Ultrasound post-operatively. (A) Long-axis view of the surgical area, with no significant abnormalities observed. (B to D) show the trachea, both internal jugular veins, the left thyroid, and the right surgical area at different levels, with no significant abnormalities observed. (E and F) show the ultrasound findings 7 months after surgery. At different levels of the neck, the trachea, both internal jugular veins, the left thyroid, and the right surgical area are visible, with no significant abnormalities observed (scale bar, 1 cm).
