Abstract. Emerging evidence suggests that microRNAs (miRs) play critical roles in the development and progression of non-small cell lung cancer (NSCLC). In a previous study, the present authors demonstrated that miR-154 acts as a tumor suppressor in NSCLC; however, its underlying molecular mechanism and target in NSCLC remain poorly understood. In the present study, ectopic expression of miR-154 remarkably suppressed cell migration and invasion in NSCLC cells. Zinc finger E-box binding homeobox 2 (ZEB2) was identified as a direct target of miR-154 in NSCLC cells. Furthermore, overexpression of miR-154 could decrease the expression of ZEB2 at the messenger RNA and protein levels. Ectopic expression of miR-154 also increased the levels of E-cadherin, an epithelial marker, and decreased the levels of vimentin, a mesenchymal marker, which contributed to suppress epithelial-mesenchymal transition (EMT) and to inhibit cell migration and invasion. In addition, downregulation of ZEB2 exerted similar effects to those caused by miR-154 overexpression on NSCLC cell migration and invasion, while upregulation of ZEB2 could significantly reverse the inhibitory effects on migration and invasion caused by miR-154 on NSCLC cells. These findings demonstrated that miR-154 inhibited migration and invasion of NSCLC cells by regulating EMT through targeting ZEB2, suggesting that miR-154 may be a potential anticancer therapeutic target for NSCLC.

Introduction

Non-small cell lung cancer (NSCLC), which represents ~75-85% of all lung carcinomas, is one of the most common causes of cancer-associated mortalities worldwide (1,2). The majority of NSCLC patients are diagnosed at an advanced stage, presenting with metastatically or locally advanced disease, leading to ~90% of lung cancer patients succumbing to metastasis (3). The metastasis progression of NSCLC involves multi-step genetic events, and the molecular underlying mechanisms have not been documented to date (4). Accumulating evidence has revealed that non-coding small RNAs are involved in NSCLC initiation, progression and metastasis (5,6), which provides novel insights for the treatment of this disease.

MicroRNAs (miRs) or miRs are a class of small, non-coding RNAs of ~19-25 nucleotides in length, which regulate gene expression at the post-transcriptional level by interacting with the 3'-untranslated regions (3'UTRs) of their target messenger (m)RNAs (7,8). Increasing evidence has suggested that miRNAs are involved in a number of biological processes, including development, differentiation, apoptosis, metabolism, immunity and tumor progression (5,7,9). In addition, a growing body of evidence strongly suggests that the dysregulation or dysfunction of miRNAs may modulate tumor initiation and progression, and may participate in tumor cell invasion and metastasis (5,9-14). miRNAs may function as oncogenes or tumor suppressors depending on their specific target genes (15).

The miR-154 cluster, which is located in the human imprinted 14q32 domain (mouse chromosome 12F2), has been identified as a tumor suppressor in various types of human cancer, including prostate (16), breast (17), colorectal (18) and thyroid cancer (19). For NSCLC, a previous study by the present authors revealed that miR-154 expression is downregulated in human primary NSCLC tissues and cell lines, and that exogenous miR-154 significantly suppressed NSCLC growth in vitro and in vivo (20), suggesting that miR-154 has potential therapeutic application against NSCLC. However, the molecular mechanisms by which it exerts its functions remain largely unknown. Thus, the identification of novel miR-154 targets would provide novel insights into the molecular mechanism underlying the miR-154-induced inhibition of tumorigenic properties in cancer cells.

The present study aimed to investigate the role and mechanism of miR-154 in the migration and invasion of NSCLC. Overexpression of miR-154 significantly suppressed the migration and invasion abilities of NSCLC cells in vitro. In addition, the epithelial-mesenchymal transition (EMT) regulator zinc finger E-box binding homeobox 2 (ZEB2) was identified as one of the direct target genes of miR-154. miR-154 inhibited cell migration and invasion by regulating EMT through inhibiting the function of ZEB2.

Key words: non-small cell lung cancer, miR-154, ZEB2, migration, invasion

Materials and methods

Cell culture. The human NSCLC cell line A549 was purchased from the Institute of Biochemistry and Cell Biology of the Chinese Academy of Sciences (Shanghai, China). Cells were cultured in RPMI-1640 medium (Gibco; Thermo Fisher Scientific, Inc., Waltham, MA, USA) in the presence of 10% heat-inactivated fetal bovine serum (FBS) (HyClone; GE Healthcare Life Sciences, Chalfont, UK) and penicillin (100 U/ml; Sigma-Aldrich, St. Louis, MO, USA) in a humidified 5% (v/v) atmosphere of CO₂ at 37°C.

Plasmids and transfection. miR-154 mimic and the corresponding negative control (mir-NC), as well as a small interfering (si)RNA targeting ZEB2 (si-ZEB2) and the corresponding scramble control (si-Sumble), were purchased from Shanghai GenePharma Co., Ltd. (Shanghai, China). The ZEB2 overexpression plasmid (pcDNA3.0-ZEB2) was generated according to the following primers: Sense 5'-GGGGTACCATGCGAACGCCATCCTG-3' and antisense 5'-TTGGCGGCGCGTGTTCTCAAGAACAGGGTTG-3'. The polymerase chain reaction (PCR) fragment was inserted into the pcDNA3.0 vector within the KpnI and NotI restriction sites (Invitrogen; Thermo Fisher Scientific, Inc.). The 3'-UTRs of human wild-type (WT) ZEB2 (pGL3-ZEB2 WT; Promega Corporation, Madison, WI, USA) containing the potential binding sites of miR-154 were amplified and constructed as described by Guan et al (21). Mutations (MUT) in the miR-154 binding sites module of ZEB2 (pGL3-ZEB2 MUT) were introduced using the QuickChange Site-Directed Mutagenesis kit (Stratagene; Agilent Technologies, Inc., Santa Clara, CA, USA), according to the manufacturer's protocol.

Transfection was performed in A549 cells using Lipofectamine 2000 (Invitrogen; Thermo Fisher Scientific, Inc.), according to the manufacturer's protocol.

RNA extraction and reverse transcription-quantitative PCR (RT-qPCR). Total RNA was extracted from cells using TRIzol (Invitrogen; Thermo Fisher Scientific, Inc.), according to the manufacturer's protocol. RNA was reverse transcribed into complementary DNA using PrimeScript™ One Step RT-PCR kit (Takara Biotechnology Co., Ltd., Dalian, China), following the manufacturer's protocol. RT-qPCR was performed using a standard SYBR Green PCR kit (Takara Biotechnology Co., Ltd.) on a 7900HT Fast Real-Time PCR System (Applied Biosystems; Thermo Fisher Scientific, Inc.). The forward and reverse primers for ZEB2 were 5'-AGAGACGGTGATATCG-3' and 5'-TGGGACACTCGTAAAGG-3', respectively; for glyceraldehyde 3-phosphate dehydrogenase (GAPDH) were 5'-GAAGGTGTAAGGTTGAGTC-3' and 5'-GGAGATGGTGATGGATTTC-3', respectively. The reaction volume was 10 µl, and the mixture contained 5 µl SYBR Premix Ex Taq, 1 µl cDNA, 0.2 µl (10 µM) ZEB2 forward primer and ZEB2 reverse primer, or 0.2 µl (10 µM) GAPDH forward primer and GAPDH reverse primer, and 3.6 µl dH₂O. The reaction conditions used for mRNA detection were as follows: 95°C for 5 min, followed by 40 cycles of 95°C for 5 sec, 60°C for 20 sec and 72°C for 20 sec. Relative quantification of ZEB2 was presented as the fold-change upon normalization to the GAPDH RNA levels, according to the equation 2−ΔΔCq (22) in the Rotor-Gene 6000 software version 1.7 (Qiagen GmbH, Hilden, Germany).

Cell migration and invasion assays. For the migration assays, A549 cells were harvested 48 h post-transfection, and 5x10³ cells in 200 µl serum-free RPMI-1640 medium were seeded into the upper Transwell chamber (pore size, 8 mm; Corning Life Sciences, Tewksbury, MA, USA). For the invasion assays, transfected cells in 200 µl serum-free RPMI-1640 medium were placed into the upper chamber of an insert coated with Matrigel (BD Biosciences, San Jose, CA, USA), according to the manufacturer's protocol. RPMI-1640 medium containing 20% FBS was added to the lower chamber. Following 24 h of incubation, the cells remaining on the upper membrane were removed with cotton swabs, whereas those that had migrated or invaded through the membrane were fixed in 90% ethanol (Sigma-Aldrich) and stained with 0.1% crystal violet (Sigma-Aldrich). The number of cells migrating or invading were photographed and counted at five randomly selected fields under an IX51 inverted microscope (Olympus Corporation, Tokyo, Japan; magnification, x200). All experiments were independently repeated three times.

Luciferase assay. A549 cells (2x10⁵) were seeded in a 24-well plate for 24 h prior to be co-transfected with pGL3-ZEB2 WT or pGL3-ZEB2 MUT and miR-154 or miR-NC using Lipofectamine 2000. Cells were collected 48 h post-transfection, and Renilla and firefly luciferase activities were assayed with the Dual-Luciferase® Reporter Assay System (Promega Corporation), according to the manufacturer's protocol. The specific activity was expressed as the fold-changes of the experimental group vs. those of the miR-NC group.

Western blotting. Cells were lysed in ice-cold radioimmuno precipitation assay buffer (Santa Cruz Biotechnology, Inc., Dallas, TX, USA) at 48 h post-transfection. Proteins were quantified using Pierce BCA Protein Assay kit (Thermo Fisher Scientific, Inc.). Equal amounts of protein (30 µg) were separated by 10% sodium dodecyl sulfate polyacrylamide gel electrophoresis (Bio-Rad Laboratories, Inc., Hercules, CA, USA) for 2 h at 120 V, and then transferred to nitrocellulose membranes (Invitrogen; Thermo Fisher Scientific, Inc.). Membranes were blocked in 4% dry milk diluted with Tri-buffered saline Tween-20 (20 mmol/l Tris-HCl, 150 mmol/l NaCl (pH 7.5) and 0.1% Tween-20) at room temperature for 1 h, and immunostained with the following primary antibodies at 4°C overnight: Rabbit monoclonal anti-human ZEB2 (1:1,000 dilution; cat. no. sc-48789; Santa Cruz Biotechnology, Inc.), mouse monoclonal anti-human E cadherin (1:1,000 dilution; cat. no. sc-8426; Santa Cruz Biotechnology, Inc.), rabbit monoclonal anti-human vimentin (1:1,500 dilution; cat. no. sc-5565; Santa Cruz Biotechnology, Inc.) and rabbit monoclonal anti-human GAPDH (1:5,000; cat. no. 2118L; Cell Signaling Technology, Inc., Danvers, MA, USA). Next, membranes were incubated with horseradish peroxidase-conjugated goat anti-rabbit or goat anti-mouse secondary antibody (1:1,000 dilution; Tris-HCl, 150 mmol/l NaCl (pH 7.5) and 0.1% Tween-20) at room temperature for 1 h, and immunostained with the following primary antibodies at 4°C overnight: Rabbit monoclonal anti-human ZEB2 (1:1,000 dilution; cat. no. sc-48789; Santa Cruz Biotechnology, Inc.), mouse monoclonal anti-human E cadherin (1:1,000 dilution; cat. no. sc-8426; Santa Cruz Biotechnology, Inc.), rabbit monoclonal anti-human vimentin (1:1,500 dilution; cat. no. sc-5565; Santa Cruz Biotechnology, Inc.) and rabbit monoclonal anti-human GAPDH (1:5,000; cat. no. 2118L; Cell Signaling Technology, Inc., Danvers, MA, USA). Protein levels were normalized to those of GAPDH.
Statistical analysis. Statistical significance was determined by Student’s t-test using GraphPad Prism version 5 software (GraphPad Software, Inc., La Jolla, CA, USA). Data were expressed as the mean ± standard deviation. All experiments were repeated ≥3 times, and each experiment consisted of triplicate wells. P<0.05 was considered to indicate a statistically significant difference.

Results

**miR-154 inhibited migration and invasion of NSCLC cells.** To examine the effect of miR-154 on the migration and invasion abilities of NSCLC cells, miR-154 mimic or miR-NC were transfected into A549 cells, and *in vitro* migration and invasion assays were then performed. Transwell assay demonstrated that miR-154 significantly repressed *in vitro* the migration and invasion abilities of NSCLC cells (P<0.01; Fig. 1A and B, respectively).

**ZEB2 was a target of miR-154 in NSCLC cells.** To detect the molecular mechanism by which miR-154 suppresses the metastasis of NSCLC cells, putative target genes of miR-154 in human cells were predicted using the tools miRanda (http://www.microrna.org/), PicTar (http://pictar.mdc-berlin.de/) and TargetScanS version 6.2 (http://www.targetscan.org/). Among the predicted candidates, ZEB2 was selected as a miR-154 target gene, since ZEB2 has been demonstrated to be involved in the development and metastasis of various types of human cancer (23,24). As indicated in Fig. 2A, miR-154 contains one predicted binding site in the 3'-UTR of ZEB2 mRNA. Luciferase activity assay revealed that miR-154 significantly inhibited the luciferase activity of wild-type ZEB2 3'-UTR, while it had no effect on the luciferase activity of mutant ZEB2 3'-UTR, compared with the control. *P*<0.01 vs. control. miR, microRNA; NC, negative control; WT, wild-type; MUT, mutation/mutant; UTR, untranslated region; ZEB2, zinc finger E-box binding homeobox 2.

**Overexpression of miR-154 regulates ZEB2 expression and EMT.** To determine whether miR-154 affects the regulation...
of endogenous ZEB2, endogenous ZEB2 mRNA and protein expression levels were measured in the A549 cells transfected with miR-154 mimic or miR-NC by RT-qPCR and western blotting, respectively. The results demonstrated that overexpression of miR-154 significantly downregulated ZEB2 mRNA and protein levels in A549 cells (P<0.01; Fig. 3A and B, respectively). These findings suggested that ZEB2 is a bona fide target of miR-154. It has been previously demonstrated that ZEB2 is a vital EMT inducer through suppressing E-cadherin expression or inducing vimentin expression in human cancer (24,25).

To further confirm that ZEB2 acts as a target of miR-154, the effect of miR-154 on two downstream effectors of ZEB2 was examined by western blotting. As indicated in Fig. 3B, overexpression of miR-154 in A549 cells markedly upregulated the protein expression of E-cadherin, an epithelial marker, and downregulated that of vimentin, a mesenchymal marker, which contributed to suppress EMT and to inhibit cell migration and invasion. Taken together, the present data indicate that miR-154 could directly inhibit ZEB2 expression and regulate EMT in NSCLC cells.
Accumulating evidence has demonstrated that miRNAs could play crucial roles in tumor growth, migration, invasion and angiogenesis in various malignances such as NSCLC (6,26). For instance, Yongchun et al (27) reported that miR-195 could decrease cell proliferation, migration and invasion of NSCLC via the proto-oncogene Myb. You et al (28) observed that miR-132 blocks the migration and invasion of NSCLC cells through targeting the EMT regulator ZEB2. Yu et al (29) reported that upregulation of miR-1 inhibited A549 cell proliferation, migration and invasion by regulating phosphatidylinositol-4,5-bisphosphate 3-kinase catalytic subunit alpha through the phosphoinositide-3-kinase/Akt signaling pathway. Shan et al (30) noticed that ectopic expression of miR-153 significantly inhibited the proliferation, migration and invasion of NSCLC cells in vitro by targeting a disintegrin and metalloproteinase 9. The present results indicated that miR-154 was involved in the migration and invasion of NSCLC.

MiR-154, a recently identified miRNA, has been reported to act as a tumor suppressor in a variety of tumors by targeting several oncogenes (15,17,30,31). For example, Zhu et al (16,31) reported that miR-154 inhibited the growth of prostate cancer cells by targeting high-mobility group AT-hook 2 and cyclin D2 (CCND2). Xin et al (18) reported that miR-154 remarkably suppressed cell proliferation, colony formation, migration and invasion in colorectal cancer cells by targeting Toll-like receptor 2. Wang et al (32) reported that overexpression of miR-154 suppressed tumor cell malignance and G1/S transition in hepatocellular cancer cells by targeting CCND2. In the present study, miR-154 could significantly inhibit the migration and invasion of NSCLC cells by targeting ZEB2.

ZEB2/Smad interacting protein 1, as a member of the delta EF-1 family of two-handed zinc finger factors, has been observed to be elevated in various types of human cancer,
including NSCLC (23,33). Growing evidence suggests that ZEB2 could induce EMT through suppressing E-cadherin expression or inducing vimentin expression, thus facilitating the metastasis of cancer cells (24,25,34,35). ZEB2 is regulated by several miRNAs, including miR-132 (28), miR-101 (36), miR-141 (37), miR-144 (21) and miR-335 (38). In the present study, ZEB2 was observed to be a target of miR-154 by luciferase assay, and miR-154 could inhibit EMT and decrease the expression of ZEB2 at the mRNA and protein levels. In addition, underexpression of ZEB2 exerted similar effects to those caused by miR-154 on NSCLC cells in terms of migration and invasion, while overexpression of ZEB2 could significantly reverse the inhibitory effects of miR-154 on NSCLC cell migration and invasion. These findings suggested that miR-154 inhibited cell migration and invasion of NSCLC by targeting ZEB2 through inhibiting EMT.

In summary, the present study offers evidence that miR-154 acts as a tumor suppressor and blocks in vitro migration and invasion of NSCLC cells partially through the downregulation of ZEB2, leading to EMT inhibition. The present data provide novel insights into the mechanism responsible for the development of human NSCLC. Therefore, miR-154 could be regarded as a novel therapeutic target for NSCLC.
